2. The sum of the measures of the supplement and complement of an angle is 184°. Find the measure of the angle, the complement and the supplement. (7 pts.)

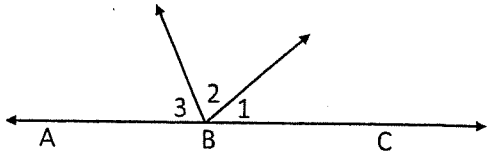
Let x = the angle
$180-x$ = the supplement
$90-x$ = the complement

$180-x+90-x=184$
$270-2x=184$
$86=2x$
$43=x$

angle = 43
complement = 47
supplement = 137

3. A, B and C are collinear. $\angle 1$, $\angle 2$ and $\angle 3$ are in the ratio of 4 : 5 : 7. Find the measure of each angle. (6 pts.)

label!



m∠1 = 45
m∠2 = 225/4
m∠3 = 315/4

$m\angle 1+m\angle 2+m\angle 3=180$

Let $4x=m\angle 1$
$5x=m\angle 2$
$7x=m\angle 3$

$4x+5x+7x=180$
$16x=180$
$x=11\frac{1}{4}$
or
$\frac{45}{4}$

$m\angle 1$: $4x=4\left(\frac{45}{4}\right)$ → $m\angle 1=45°$

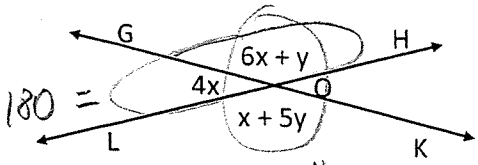
$m\angle 2$: $5x=5\left(\frac{45}{4}\right)=\frac{225}{4}$

$m\angle 3$: $7x=7\left(\frac{45}{4}\right)=\frac{315}{4}$

4. Find the measure of $\angle GOL$ and $\angle GOH$. (7 pts.)

2 variables need 2 eq's!

Put system in a box!



$180=$

vertical angles ≅

EQ#1: $6x+y=x+5y$
EQ#2: $4x+6x+y=180$

Now solve!

Substitution:
$4x+6x+y=180$
$10x+y=180$
$y=180-10x$

$6x+y=x+5y$
$6x+(180-10x)=x+5(180-10x)$
$6x+180-10x=x+900-50x$
$-4x=720-49x$
$45x=720$
$x=16$

$y=180-160$
$y=20$

$m\angle GOL=4x$
$=4(16)$
$=64$

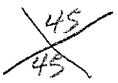
$m\angle GOH=116$

$6x+y$
$6(16)+20$

5. Determine if the following statements are sometimes, always or never true. Justify your answer. (3 pts. Ea.)

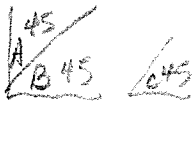
a. Vertical angles are complementary. Sometimes

If vertical angles are each 45, then complementary



If any other measurement, then not complementary

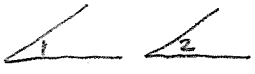
b. If ∠A is complementary to ∠B and ∠B complementary to ∠C, then ∠A is complementary to ∠C. Sometimes



← the complement to ∠B is always 70°. Therefore, ∠A and ∠C will be the same measures, not complementary.

c. If ∠1 ≅ ∠2, then ∠1 and ∠2 are vertical angles.

Not vertical Sometimes



Not vertical

$m\angle 7 = 42$

$m\angle 8 = 90$

$m\angle 9 = 48$

$(x-6)(x+4) = 0$

$x = 6 \quad x = -4$

$36 + 12 = 48$ | $16 - 8 = 8$

$m\angle 1 = 132$ | $m\angle 1 = 172$

$x = 60$

$60 + y = 180$

$y = 120$
